Report Overview:

Electrophysiology (EP) is the study of the mechanism, function and performance of electrical signaling pathways that guide the functioning of the heart. EP study is a procedure that is performed to diagnose arrhythmias by locating areas of heart tissue that interrupt the normal functioning of the heart's electrical system. During an EP study, the electrophysiologist inserts several long, flexible tubes with wires, called catheters, into the heart to record electrical activity within the heart chambers and to detect abnormal electrical pathways. The second part of the test involves electrical stimulation of various parts of the heart to induce an abnormal heart rhythm. This helps the electro physiologist in treatment mapping, which could involve surgical removal of the abnormal tissue in the heart using a catheter.

The Global Electrophysiology (EP) Device Market Size was estimated at USD 6142.05 million in 2023 and is projected to reach USD 8614.45 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
