Abstracts

Electropolishing units are electrochemical systems designed to remove surface material from metal components through an anodic dissolution process in an electrolytic bath, resulting in a smooth, polished, and often passivated finish that enhances corrosion resistance, reduces micro-roughness, and improves cleanability. These systems typically consist of a rectified power supply, a temperature-controlled tank for the electrolyte (commonly a mixture of acids such as phosphoric and sulfuric acid), electrodes, and fixturing to hold the workpiece, with variations in size and automation to accommodate different industrial scales?from small benchtop units for precision medical or aerospace components to large, fully automated systems for high-volume manufacturing in sectors like pharmaceuticals, food processing, and semiconductor fabrication. The process is valued for its ability to produce uniform results on complex geometries, deburr edges, and eliminate surface contaminants without mechanical contact, making it distinct from traditional mechanical polishing methods.

The global Electropolishing Units market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
