Report Overview

Electroslag remelting steel ingot is a steel ingot manufactured through electroslag remelting process. This process mainly uses high-intensity current to generate heat in electroslag, heat and melt raw materials such as scrap steel and scrap iron, and obtain steel ingots with certain chemical composition and performance requirements through special treatment and adjustment of ingredients. Electroslag remelting steel ingots have the following characteristics: 1. High purity: Through the electroslag remelting process, impurities and oxides in scrap steel can be effectively removed, improving the purity and quality of steel ingots. 2. Good uniformity: During the melting process of electroslag remelted steel ingots, through operations such as stirring and furnace turning, the components in the molten steel can be made more uniform and the uniformity and consistency of the steel ingots can be improved. 3. Strong controllability: The electroslag remelting process can accurately control the temperature and composition of the molten steel as needed, so that the performance and chemical composition of the steel ingot meet the requirements. 4. Energy saving and environmental protection: Compared with traditional smelting processes, the electroslag remelting process can effectively utilize resources such as scrap steel and reduce energy consumption and environmental pollution.

The global Electroslag Remelting Steel Ingot market size was estimated at USD 485.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
