Abstracts

The electrostatic capacitance non-contact displacement meter is a sensor that uses the principle of electrostatics to measure the displacement of an object. It determines the position or displacement of an object by detecting the change in capacitance between the electrode and the object being measured. When the object approaches or moves away from the sensor, the capacitance value changes, which is then converted into a displacement signal. This type of displacement meter has the advantages of high precision, fast response and non-contact measurement. It is widely used in precision measurement, electronic equipment, automation control, nanotechnology and other fields, and is suitable for applications with high requirements for accuracy and stability.

The global Electrostatic Capacitive Non-Contact Displacement Meter market size was estimated at USD 1594.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
