## Abstracts

Electrostatic dissipative laminates are composite materials designed to prevent the buildup and discharge of static electricity. They are composed of a laminate structure that typically includes a base material such as a polymer or a combination of polymers. These laminates have a surface resistivity in a specific range that allows static electricity to dissipate slowly and safely, rather than building up and causing electrostatic discharge events. This property makes them crucial in environments where electrostatic discharge can damage sensitive electronic components, ignite flammable substances, or attract dust and contaminants. They are widely used in electronics manufacturing, cleanrooms, and other settings where static control is essential.

The global Electrostatic Dissipative Laminates market size was estimated at USD 1675.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
