Abstracts

The electrostatic gyroscope is a gyroscope that uses the strong electric field in an ultra-high vacuum environment to generate a supporting force, thereby replacing the mechanical bearings of traditional gyro motors and universal brackets to achieve free suspension of the spherical rotor. The core of the electrostatic gyroscope lies in its non-contact support method. In the ultra-high vacuum spherical cavity, a high voltage is applied through the electrode to form an electrostatic field, which generates an electrostatic attraction on the spherical rotor, causing it to suspend and rotate stably. When the rotor deviates from the center position, the electrode voltage is automatically adjusted to return the rotor to the center to achieve stable suspension. The electrostatic gyroscope is mainly composed of a spherical rotor, a ceramic shell assembly, an electrostatic support system, a photoelectric signal device, a magnetic field torque device, and other parts. The rotor is usually made of lightweight materials such as aluminum or beryllium to ensure stability and accuracy during high-speed rotation.

The global Electrostatic Gyroscope market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
