Abstracts

Electrosurgical forceps are specialized surgical instruments designed for simultaneous tissue manipulation and energy delivery, combining the mechanical function of traditional forceps with the capability to conduct high-frequency electrical currents for precise cutting, coagulation, and sealing of tissue during surgical procedures. These instruments typically feature insulated handles and conductive tips, allowing surgeons to apply controlled electrosurgical energy—either monopolar or bipolar—directly to targeted anatomical structures, thereby minimizing blood loss, reducing procedure time, and enhancing surgical precision across a wide range of specialties, including general surgery, gynecology, cardiovascular, and orthopedic operations.

The global Electrosurgical Forceps market size was estimated at USD 1320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
