Report Overview:

Electrosurgical generators are devices that use high-frequency electric current to cut or coagulate tissue during surgery. It converts electrical energy into high-frequency electric current, which uses specific controls for its operation. Electrosurgery is the application of high frequency (radio frequency) alternating polarity, current as a means of cutting biological tissue. Its benefits include the ability to perform precise cuts with limited blood loss. Electrosurgical devices are frequently used in surgery to help prevent blood loss in hospital operating rooms or outpatient procedures. The procedure cuts or destroys tissue and controls bleeding using an electrical current procedure through electrodes placed on or near the tissue. Electrosurgery can be used to treat basal cell skin cancer or other types of skin problems such as actinic keratoses, warts, and moles.
