Abstracts

The elevator drop buffer is a safety device used in elevator systems to prevent serious damage to passengers and elevator equipment when the elevator falls or suddenly slides down. It absorbs the impact energy during the elevator fall, slows down the elevator's descent speed, and ensures that the elevator can stop safely in extreme situations. The elevator drop buffer is usually installed at the bottom of the elevator shaft or the bottom of the elevator car as an emergency brake device. The working principle of the elevator drop buffer is to use its internal elastic material, hydraulic system or mechanical structure to absorb the kinetic energy of the elevator when it falls. When an abnormal situation occurs in the elevator, the buffer will be quickly activated to slow down the elevator's descent speed and eventually stop safely, avoiding direct collision between the elevator and the bottom of the shaft and reducing damage to personnel and equipment. According to data released by the National Bureau of Statistics, China's elevator production in 2022 was 1.455 million units, which was down 5.8% compared to last year. After years of development, China has become the world's largest elevator producer and consumer. More than 70% of the world's elevator manufacturing business were in Chinese mainland, and 60%-65% of the world's elevators sold in the Chinese market. According to data from the China Elevator Association, by the end of 2022, the number of elevators registered in operation in China has reached 9.65 million, and more than 15,000 elevators have been installed after acceptance.

The global Elevator Safety Buffer market size was estimated at USD 409.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
