Abstracts

An elevator seismic sensor is a crucial safety device installed in elevators. It is designed to detect seismic activities such as earthquakes. When an earthquake occurs, it can quickly sense the vibrations, changes in acceleration, velocity or displacement of the ground. Based on the detected signals, it promptly sends messages to the elevator control system, which then takes necessary actions like stopping the elevator at the nearest floor and opening the doors to ensure the safety of passengers inside. Different types of elevator seismic sensors, including accelerometer-based ones, velocity sensor types, and displacement sensor ones, each have their own characteristics in accurately capturing the relevant parameters related to the seismic events, all aiming to protect the well-being of those using the elevator during such potentially dangerous situations.

The global Elevator Seismic Sensor market size was estimated at USD 127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
