## Abstracts

Antimicrobial catheters refer to catheters coated or infiltrated with antibacterial drugs, disinfectants, and metal-containing preparations. Anti-infective substances may coat the catheter, or attach to the catheter by chemical bonding. The anti-infection principle of the catheter is that when the catheter is exposed to blood, body fluids or other liquids, the anti-infective substance will be released around the catheter to form an anti-infective environment to resist microorganisms, thereby preventing the propagation and migration of bacteria colonizing the catheter.

The global Embedded Anti Microorganism Coating Tube market size was estimated at USD 1403.91 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
