Report Overview

Embedded systems are often used in industrial settings for automation and control of factory systems and machinery. Embedded systems are used in larger systems to perform specific tasks, such as controlling motors and valves, assembly-line speed, adjusting temperatures and other variables, and managing networking equipment. The overall purpose of embedded systems for automation and control is to control processes in order to maximize the performance and efficiency of the overall process. Also, its purpose is to produce the best product possible, all while operating reliably and optimally in challenging environments.

Typically, embedded systems for automation and control are made from the same components that go into consumer-grade desktop computers. These components include the CPU, GPU, chipset, storage, and I/O ports. That said, there is one vital difference between components that are used in regular desktop PCs and those used in industrial embedded systems. The components in industrial embedded systems have been tested and validated to operate reliably in challenging environments. However, the components in regular computers are not capable of performing properly in challenging industrial environments. Ultimately, the entire package allows embedded computer systems to communicate with machines, devices, and other equipment located in industrial settings, as well as allow such devices to communicate with the cloud via the internet.
