## Abstracts

Embedded Microwave Waveguide Isolator is a specialized passive component designed for use in microwave communication systems to ensure unidirectional signal transmission. It consists of a main waveguide and a coupled waveguide, with a specific structural design that allows microwave signals to pass only in one direction. When a signal travels through the main waveguide, the isolator permits smooth transmission; however, when a signal encounters a reflection, the isolator diverts the reflected wave into the coupled waveguide, thereby preventing it from returning to the signal source. This effectively reduces the instability of the signal source and potential interference issues.

The global Embedded Microwave Waveguide Isolator market size was estimated at USD 394.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
