Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Embedded SiC Carbide Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Embedded silicon carbide modules are high-efficiency power modules that integrate silicon carbide power chips, driver circuits, and heat dissipation substrates. They are widely used in new energy vehicle electric drive systems, photovoltaic inverters, energy storage converters, and industrial motor drives. They feature high power density, high efficiency, and high voltage resistance. Global sales in 2024 are expected to reach approximately 3.2 million units, with an average unit price of approximately US\$210. Single-line production capacity is approximately 250,000 units. Upstream suppliers primarily include silicon carbide wafer, substrate material, chip manufacturing, and packaging and testing companies, while downstream suppliers primarily include new energy vehicle, photovoltaic inverter, and energy storage system manufacturers. In terms of downstream consumption, for example, a pure electric vehicle's drive system typically requires two to three embedded silicon carbide modules, equivalent to an average of 2.5 modules per vehicle. In photovoltaic inverters, a 100kW inverter consumes approximately two modules on average, while a 1MW power converter consumes approximately 18 modules. The overall gross profit margin is approximately 28%.

The global Embedded SiC Carbide Module market size was estimated at USD 672.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
