Report Overview

Embedded SIM chip refers to embedding the SIM card into the device and updating its configuration through wireless remote download. Compared with the traditional pluggable SIM card, the embedded SIM card greatly reduces the card space on the device, and its volume is reduced to 10% of the traditional SIM card. In addition, it is directly embedded in the device in form, realizing the card-free nature of the real device, thus increasing the flexibility of product design; Its seismic resistance, high temperature resistance and reliability are stronger, and it can better adapt to the harsh working environment; Not bound to a specific operator and remote configuration support flexible switching of operator data to ensure fast and stable connection.

The global Embedded SIM IC market size was estimated at USD 4431 million in 2023 and is projected to reach USD 9233.56 million by 2032, exhibiting a CAGR of 8.50% during the forecast period.
