Abstracts

The embodied intelligent control system is an advanced artificial intelligence technology that allows intelligent agents to realize the three main links of "perception, decision-making, and control" through the interaction of the physical body and the environment. It mainly functions in two parts: the first is the "brain" of the humanoid robot based on the large artificial intelligence model, which is mainly reflected in environmental perception, behavior control, human-computer interaction, etc.; the second is the "cerebellum" that controls the movement of the humanoid robot, which is mainly reflected in its motion control aspect. Its system architecture is divided into: bottom transmission equipment, operating system communication protocol stack, motion control system construction, and algorithm library construction from the perception layer, middle layer, decision-making layer to control layer.

The global Embodied Intelligent Robot Control System market size was estimated at USD 122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 52.00% during the forecast period.
