Abstracts

The embodied training platform is an intelligent training system built on embodied intelligence, virtual simulation, reinforcement learning, and multimodal perception technologies. It aims to enable intelligent agents (such as robots, virtual humans, autonomous vehicles, or intelligent agents) to autonomously learn and evolve their capabilities within a closed loop of "perception-decision-action." This platform simulates real-world interactive scenarios through highly realistic virtual or physical experimental environments, enabling intelligent agents to plan actions, execute tasks, adapt to the environment, and optimize strategies in complex and changing environments, thereby acquiring "embodied intelligence" with practical operational capabilities and cognitive reasoning abilities. The core of the platform typically includes a perception modeling module (sensory inputs such as vision, force, and hearing), an interaction and simulation module (physics engine and environmental simulation), a learning algorithm module (reinforcement learning, imitation learning, self-supervised learning, etc.), and an evaluation and transfer module (virtual-to-real-world policy transfer and performance verification). It can be widely applied in industrial manufacturing, medical rehabilitation, autonomous driving, intelligent service robots, education and entertainment, and other fields. It helps intelligent agents achieve efficient transition from virtual training to real-world deployment and enhance their autonomous decision-making capabilities, while also promoting the integration of AI with real-world cognitive and action capabilities. The downstream customers of the embodied training platform primarily include various industries and businesses that require intelligent agents to autonomously perceive, make decisions, and act in complex environments. Specifically, industrial manufacturers use the platform to train robots to perform tasks such as assembly, handling, and quality inspection, thereby improving production efficiency and automation. Medical institutions and rehabilitation centers use the platform to train rehabilitation assistance robots, enhancing the precision of nursing and rehabilitation services. Autonomous driving

companies and intelligent transportation companies use the platform to optimize vehicle perception, path planning, and decision-making strategies, achieving safe and efficient driving systems. Service robot and smart home companies rely on the platform to train robots to perform tasks such as cleaning, food delivery, and navigation in homes, offices, and public spaces. Education and entertainment institutions use the platform to train virtual characters or interactive robots for personalized teaching and immersive experiences. Overall, downstream user demand for embodied training platforms focuses on autonomous learning capabilities, task execution accuracy, environmental adaptability, and multimodal interaction capabilities. The platform's value lies in accelerating the transition of intelligent agents from virtual training to real-world applications. The embodied training platform has a gross profit margin of 50%.

The global Embodied Training Platform market size was estimated at USD 2533.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 19.20% during the forecast period.
