Abstracts

An embolization coil system is a minimally invasive medical device used in interventional radiology and neurosurgery to intentionally block or reduce blood flow to specific blood vessels, aneurysms, or vascular malformations. These systems typically consist of soft, flexible metallic coils—often made of platinum or other biocompatible materials—which are delivered via catheter to the target site, where they promote thrombosis and occlusion. Designed for precision and controlled deployment, embolization coils are employed in treating conditions such as cerebral aneurysms, uterine fibroids, traumatic bleeding, and arteriovenous malformations, offering an alternative to open surgery with benefits like reduced recovery times and lower complication risks.

The global Embolization Coil System market size was estimated at USD 1225.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
