Abstracts

Emergency lighting UPS systems are specialized uninterruptible power supplies designed to provide reliable backup power for emergency lighting fixtures during power outages, ensuring continuous illumination for safe egress and evacuation in commercial, industrial, and public buildings. These systems are distinct from general-purpose UPS units as they prioritize compliance with stringent safety standards such as NFPA 101, IEC 62034, and EN 50171 which mandate minimum runtime durations, automatic transfer switching, battery monitoring, and regular self-testing capabilities. Key components typically include maintenance-free sealed lead-acid or lithium-ion batteries, inverters for AC output (or DC-direct support for LED fixtures), and robust enclosures rated for fire resistance or hazardous environments. Their primary function is to bridge the gap between main power failure and the activation of generators or until occupants safely evacuate, making them critical for life safety applications in facilities like hospitals, schools, airports, and high-rises.

The global Emergency Lighting Ups market size was estimated at USD 1270.55 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
