Abstracts

EMI (Electromagnetic Interference) common mode inductor is a passive component used in electronic circuits to suppress electromagnetic interference. Its function is to reduce the intensity of common-mode current (flowing through two conductors at the same time, generally interference from external electromagnetic fields), thereby reducing interference between electronic devices. As the operating frequency of electronic equipment continues to increase, EMI common mode inductors need to adapt to higher frequency applications. Therefore, the development of EMI common mode inductors with high frequency response and low loss will be the future trend. Miniaturization and integration of electronic equipment is a major trend, so EMI common mode inductors require smaller and more compact designs to adapt to the requirements of modern equipment.

The global EMI Common Mode Inductors market size was estimated at USD 727.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
