Abstracts

EMI conductive paint serves as a functional coating for electromagnetic interference (EMI) shielding. It's made by combining metallic fillers like silver, copper or nickel powders with resin binders. Once applied, it forms a conductive film, effectively blocking electromagnetic radiation and attenuating EMI. The paint is applicable to non - conductive substrates like plastics and ceramics via spraying, brushing or printing. It's widely used in electronics casings, PCBs, automotive and aerospace components, evolving towards thinner, more adhesive and eco - friendly versions.

The global EMI Conductive Paint market size was estimated at USD 2239.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
