Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on EMI Shielding Gaskets and Tapes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. EMI shielding gaskets and tapes are functional materials designed to control electromagnetic interference (EMI) in electronic devices by blocking or attenuating unwanted electromagnetic emissions or intrusions. Shielding gaskets are typically made from conductive elastomers such as conductive foam, silicone, or rubber that provide compressibility and maintain electrical continuity when installed in housing seams or joints. EMI shielding tapes are adhesive-backed flexible materials coated with conductive metals (such as copper or aluminum) or conductive fabrics, which can be applied to cable wraps, enclosure seams, or localized EMI hotspots. These materials are widely used in applications requiring high electromagnetic compatibility (EMC), including telecommunications equipment, medical devices, military electronics, automotive systems, and smart consumer electronics. EMI Shielding Gaskets and Tapes are critical materials for achieving electromagnetic compatibility (EMC) in electronic systems, addressing EMI leakage and susceptibility through two complementary approaches. While both serve to ensure electrical continuity and high-frequency interference suppression, they differ in physical form, installation method, and performance focus, making them suitable for varied design and operational needs. EMI shielding gaskets are typically made from conductive rubber, metal meshes, or fabric-over-foam materials, shaped through extrusion, molding, or co-extrusion into compressible 3D structures. These are installed along enclosure seams, panel joints, or modular interfaces, offering both EMI shielding and mechanical sealing (e.g., dust and water protection). In high-reliability sectors like 5G telecommunications, aerospace, medical, and military electronics, gaskets are expected to exhibit high conductivity,

shielding effectiveness, corrosion resistance, and long-term performance. Co-extruded gaskets, which integrate conductive and non-conductive segments, are especially valued for balancing performance and cost in mid- to high-end applications. EMI shielding tapes, on the other hand, are thin, flexible materials often made of copper foil, aluminum foil, or nickel-coated fabrics with conductive or non-conductive adhesive backing. They are ideal for surface applications such as PCB grounding, seam bridging, temporary fixes, or EMI patching, offering ease of use, conformability, and cost efficiency. Key attributes include strong adhesive strength, good aging resistance, and optional features like heat resistance or flame retardancy. Due to their flexibility and low thickness, shielding tapes are widely used in compact devices such as laptops, smartphones, and wearables, where space constraints preclude the use of gaskets.

The global EMI Shielding Gaskets and Tapes market size was estimated at USD 581.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
