Abstracts

Emission Control Units are integrated systems designed to reduce harmful pollutants from exhaust gases, primarily in automotive, industrial, and power generation applications. These systems typically include components such as catalytic converters, diesel particulate filters (DPF), selective catalytic reduction (SCR) systems, and exhaust gas recirculation (EGR) valves, which work together to convert or capture pollutants like nitrogen oxides (NOx), carbon monoxide (CO), hydrocarbons (HC), and particulate matter (PM) before they are released into the atmosphere. The technology is essential for compliance with increasingly stringent environmental regulations worldwide, aimed at mitigating air pollution and its adverse effects on public health and the environment.

The global Emission Control Units market size was estimated at USD 10450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
