Abstracts

Emulsion metal cutting fluids are commonly used cooling and lubrication liquids in metalworking, typically composed of water, oil, and emulsifiers. The primary composition is a mixture of water and oil, which, through the action of emulsifiers, forms a stable emulsion. This allows the fluid to provide excellent lubrication, reducing friction and wear, while effectively dissipating heat generated during cutting to prevent overheating of the workpiece. Emulsion metal cutting fluids are widely used in turning, milling, grinding, and other metalworking processes, especially in applications that require good cooling performance and moderate lubrication for efficient cutting.

The global Emulsion Metal Cutting Fluids market size was estimated at USD 251.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
