Abstracts

Encapsulated transformers are specialized electrical devices designed to isolate and step up or step down voltage levels while being fully enclosed in a protective, often resin-based, casing that provides insulation, mechanical stability, and resistance to environmental factors such as moisture, dust, chemicals, and temperature fluctuations. Unlike open-wound or oil-filled transformers, encapsulated units are compact, maintenance-free, and suited for applications where space constraints, safety regulations, or harsh operating conditions demand a sealed, non-ventilated design. They are commonly used in industrial automation, renewable energy systems, railway infrastructure, medical equipment, and telecommunications, offering enhanced reliability and longevity by preventing internal component exposure to external contaminants.

The global Encapsulated Transformer market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
