## Abstracts

An enclosed AC reactor is a type of AC reactor that is housed within an enclosure. The enclosure serves multiple purposes, including protecting the internal components from external factors such as dust, moisture, and physical damage. It typically consists of a magnetic core and a winding, similar to an open - type AC reactor. The winding is usually made of insulated copper wire, and the magnetic core can be made of materials like laminated silicon steel sheets. The enclosure provides a barrier against dust and moisture. In industrial environments where there is a lot of particulate matter in the air or a high humidity level, an enclosed AC reactor can prevent these elements from contaminating the internal components. For example, in a steel mill or a paper manufacturing plant, where the air is filled with dust and fibers, an enclosed reactor can maintain its performance and reliability over a longer period compared to an open - type reactor. The enclosure can help to dampen the acoustic noise generated by the magnetic field fluctuations and the vibration of the winding. In applications such as a building's electrical distribution system or a hospital's power supply, where noise levels need to be controlled, an enclosed AC reactor can contribute to a quieter operating environment.

The global Enclosed AC Reactor market size was estimated at USD 259.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
