## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on End-functionalized Polymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. End-functionalized Polymers are polymers that have been modified at their ends (termini) with specific functional groups. These functional groups can be reactive or non-reactive and are introduced to achieve specific chemical, physical, or biological properties. The modification can enhance the polymer's ability to interact with other molecules, be crosslinked, or participate in chemical reactions, making them valuable in various applications such as coatings, adhesives, biomedical devices, and composites. The end groups can also influence the polymer's solubility, molecular weight, and compatibility with other materials. End-functionalized Polymers are increasingly driven by the need for customized properties tailored to specific applications. These polymers, modified with functional groups at their ends, allow for enhanced reactivity, compatibility, and versatility in industries such as automotive, electronics, and biomedical fields. Key market drivers include the growing demand for biocompatible materials in drug delivery and medical devices, advancements in nanotechnology, sustainability concerns, and innovations in polymer chemistry. Their ability to be fine-tuned for specific performance requirements makes them vital for various industries seeking improved material properties, such as biodegradability, adhesion, and chemical bonding, fostering continued growth in the market.

The global End-functionalized Polymers market size was estimated at USD 4839.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
