Report Overview

The End-to-End Optical Beam Smoke Detector consists of two units: a transmitter and a receiver, which are installed at opposite ends of the space. The transmitter emits a beam of light, which is received by the receiver at the other end. When smoke particles enter the path of the beam, they scatter light, which is then detected by the receiver, triggering the alarm. End-to-End Optical Beam Smoke Detector is typically used in areas where long-range smoke detection is required, such as airports, train stations and shopping malls.
