Abstracts

End-to-end segmentation refers to a comprehensive approach within computer vision where an input image is processed through a single, unified neural network model that directly outputs a fully segmented image, assigning a specific class label to each pixel without relying on intermediate steps or separate modules for region proposal, feature extraction, or post-processing. This method leverages deep learning architectures, particularly convolutional neural networks (CNNs) and more recently transformer-based models, to learn hierarchical features and spatial contexts in an integrated manner, enabling efficient and accurate pixel-wise predictions for applications such as autonomous driving, medical imaging, semantic scene understanding, and object delineation in satellite imagery.

The global End To End Segmentation market size was estimated at USD 1250.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
