Report Overview

Endocrine Therapy Drugs (ETDs) play a pivotal role in treating hormone receptor-positive cancers, such as breast and prostate cancer. These drugs function by disrupting the hormonal signaling pathways that fuel tumor growth, effectively inhibiting cancer cell proliferation. By targeting specific hormones or their receptors, ETDs offer a targeted and less toxic approach compared to traditional chemotherapy. They have revolutionized cancer management, improving survival rates, and enhancing the quality of life for patients. Ongoing research continues to refine existing ETDs and develop new ones, promising even greater efficacy and personalized treatment options for individuals battling hormone-driven cancers.
