Abstracts

"Endoscopic reprocessing medical device" means a medical device used in the reprocessing of endoscopic equipment used for the examination and treatment of internal organs or cavities. An endoscope is a medical tool that allows doctors to directly observe and manipulate a patient's internal organs through its elongated tube-like structure and lens without performing open surgery. Endoscope reprocessing refers to cleaning, disinfecting, and sterilizing the endoscope after use to ensure that the instrument is sterile, safe and reliable the next time it is used. This process is very important because during endoscopy and treatment, instruments may come into contact with the patient's blood, body fluids, etc., and if not properly reprocessed, infectious diseases may be transmitted. The world's core manufacturers of Endoscope Reprocessing Medical Device include Olympus, STERIS and Wassenburg Medical. The top three companies have about 33% of the market. North America is the world's largest Endoscope Reprocessing Medical Device market with a market share of about 38%, followed by Europe and Asia Pacific with a market share of 32% and 24%, respectively. In terms of product type, Single Chamber is the largest segment with approximately 52% market share. In terms of application, Ambulatory Surgical Center is the largest downstream segment, accounting for approximately 73% of the market.

The global Endoscope Reprocessing Medical Device market size was estimated at USD 531.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
