## Abstracts

Endoscopic Bariatric Therapy (EBT) is a minimally invasive weight loss approach primarily used for treating obesity or overweight patients. This therapy employs endoscopic techniques to modify the gastrointestinal tract, either by reducing stomach volume or altering its anatomy to limit food intake or affect nutrient absorption. Among the various EBT devices developed, the Intra-gastric Balloon (IGB) is the most widely used in clinical settings. The IGB is inserted into the stomach via endoscopy and inflated with saline or gas, partially filling the stomach to induce a feeling of fullness, thereby reducing food consumption. This therapy is suitable for patients who struggle with weight loss through conventional diet and exercise, offering a safer and reversible alternative to bariatric surgery.

The global Endoscopic Bariatric Therapy (EBT) market size was estimated at USD 163.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
