Abstracts

Endoscopic retriever bags are sterile, single-use medical devices designed for the safe containment and removal of tissue specimens, foreign bodies, or resected organs during minimally invasive endoscopic procedures, such as laparoscopic or endoscopic surgeries; they consist of a collapsible pouch attached to a deployment system, which allows the bag to be introduced through a narrow port or endoscope channel, opened intracorporeally to encase the target material, securely closed with a drawstring mechanism to prevent spillage or seeding, and then extracted from the body, thereby minimizing the risk of infection, tissue fragmentation, or cross-contamination while preserving specimen integrity for pathological examination.

The global Endoscopic Retriever Bag market size was estimated at USD 125.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
