Abstracts

An endoscope is an illuminated optical, typically slender and tubular instrument (a type of borescope) used to look deep into the body and used in procedures called an endoscopy. Endoscopes use tubes which are only a few millimeters thick to transfer illumination in one direction and high-resolution images in real time in the other direction, resulting in minimally invasive surgeries. They can be used to examine visually and diagnose, or assist in surgery such as an arthroscopy. An endoscope is a long, thin, flexible tube that has a light and camera at one end. Images of the inside of your body are shown on a television screen. Endoscopes can be put into the body through the mouth and down the throat, or through the bottom. An endoscope can also be put inside the body through a small cut (incision) made in the skin when keyhole surgery is being done.

The global Endoscopy Device market size was estimated at USD 7958.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 0.06% during the forecast period.
