Abstracts

Endoscopy irrigation tubing is an important component in endoscopic procedures. It is used to irrigate and clean the surgical site, improve visibility, and remove debris and fluids. Usually made of medical - grade plastic such as polyvinyl chloride (PVC), polyurethane, or silicone. These materials are chosen for their flexibility, durability, and biocompatibility, ensuring they can withstand the harsh environment of the endoscope and do not cause harm to the patient's body. The tubing has a smooth inner lumen through which the irrigation fluid flows. The diameter of the lumen is carefully designed to provide an appropriate flow rate of the irrigation fluid, typically ranging from a few millimeters to accommodate different endoscope models and surgical requirements.

The global Endoscopy Irrigation Tubing market size was estimated at USD 529.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
