Abstracts

Endpoint backup software refers to a type of data protection solution designed to safeguard the data stored on endpoints, such as desktops, laptops, tablets, and smartphones, within an organization's network. This software automatically backs up files, folders, applications, and system settings from individual devices to a centralized server or cloud-based storage infrastructure. An endpoint is considered "backed up" when there is a copy of important files available to restore from should something happen to the device (Eg. accidental deletion, site disaster, or hardware failure). Endpoint backup software plays a crucial role in ensuring data resilience and business continuity by mitigating the risk of data loss due to hardware failure, malware attacks, user error, or other unforeseen events. It empowers organizations to enforce data protection policies, comply with regulatory requirements, and recover quickly from data disasters. The Endpoint Backup Software market has grown significantly in recent years, driven by the increasing volume of endpoint devices—including laptops, smartphones, tablets, and desktops—in both enterprise and consumer environments. The shift to hybrid and remote work models, along with growing concerns over data security, ransomware, and compliance, has accelerated demand for comprehensive endpoint backup solutions. These software platforms are designed to protect critical data stored on endpoint devices by automatically backing up files to cloud-based or on-premises servers, ensuring business continuity and quick recovery in the event of data loss. As digital transformation continues across industries, organizations are recognizing the importance of safeguarding endpoint data that resides outside traditional data center perimeters.

The global Endpoint Backup Software market size was estimated at USD 3368.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
