Report Overview

Ablation therapies can be used for the treatment of various diseases across several medical domains such as ophthalmology, cancer, gynecology, and cardiovascular. Being a minimally invasive procedure, it is less painful than conventional surgical operations, leading to shorter recovery time. In addition, it causes very little damage to the surrounding tissues. Even though it lowers the side effects, it has some disadvantages as well. For instance, large and bulky tissues, such as bone and neck nodules, cannot be treated with ablation. Besides, the availability of ablation treatment in remote locations is quite restricted.
