Report Overview

Energy efficiency is an essential aspect in the design and operation of residential buildings. Residential energy consumption is shown to account for approximately 8% of the electricity and 3.5% of the natural gas consumption in the U.S. The heating, ventilation, and air conditioning (HVAC) system and lighting system are two major factors influencing energy consumption in residential buildings. About 52–72% of the average energy consumed by residential buildings is used to keep buildings at comfortable temperatures, provide hot water, and circulate fresh air indoors. In the service region of the Tennessee Valley Authority (TVA), 92% of the electricity is non-renewable electricity, and approximately 41% is generated by coal. Therefore, energy consumption in residential buildings directly relates to the proportion of pollutants and greenhouse gas emissions from the power plants. With the development of advanced technology and strict energy policies, however, the energy consumption in the residential sector and the corresponding emission of pollutants can be significantly reduced.

The global Energy Efficiency in Residential Buildings market size was estimated at USD 2519 million in 2023 and is projected to reach USD 4553.75 million by 2032, exhibiting a CAGR of 6.80% during the forecast period.

North America Energy Efficiency in Residential Buildings market size was estimated at USD 735.12 million in 2023, at a CAGR of 5.83% during the forecast period of 2024 through 2032.
