Abstracts

Energy Efficient Sliding Glass Door is a specialized type of door designed to maximize thermal insulation and minimize energy loss while providing aesthetic appeal and ease of access. Unlike standard glass doors, these doors feature advanced glazing technologies such as double or triple-pane glass, low-emissivity (Low-E) coatings, and gas fills (typically argon or krypton) between panes to significantly reduce heat transfer. The frames are often constructed from thermally broken aluminum, vinyl, fiberglass, or wood-clad composites to enhance insulation performance. By reducing the need for artificial heating and cooling, energy efficient sliding glass doors help lower energy bills and contribute to a building's sustainability performance. Commonly used in residential homes, commercial spaces, and green buildings, they not only improve comfort and indoor temperature regulation but also support environmental goals by reducing carbon footprints.

The global Energy Efficient Sliding Glass Door market size was estimated at USD 1357.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
