Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Energy Storage PCS Boost Integrated Cabin competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of energy storage PCS booster cabins is 5380 units, with an average selling price of US\$330,000 per unit. The energy storage PCS booster cabin is a highly integrated electrochemical energy storage solution that integrates key equipment such as the energy storage converter (PCS) and step-up transformers, high and low voltage distribution systems, and control systems into a standardized cabin. Its core function is to convert the low-voltage DC power stored in the battery into AC through the PCS, and then increase the voltage to the grid access voltage level (such as 10kV and 35kV) through the step-up transformer, thereby achieving efficient coupling between the energy storage system and the grid. This integrated design reduces the energy loss and failure risks caused by cable connections and decentralized equipment in traditional systems, and improves system efficiency, safety, and operational convenience. It is widely used in scenarios such as new energy grid connection, grid frequency and peak regulation, and industrial and commercial peak shaving and valley filling, and is one of the key forms of the current modularization and standardization of energy storage systems.

The global Energy Storage PCS Boost Integrated Cabin market size was estimated at USD 1775.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.00% during the forecast period.
