Abstracts

An engine exhaust muffler is an acoustic device integrated into the exhaust system of internal combustion engines, designed primarily to reduce noise emissions by dissipating and attenuating sound waves generated during the combustion process. It functions through a combination of chambers, perforated tubes, and sound-absorbing materials that create destructive interference to cancel out high-pressure sound pulses, thereby minimizing acoustic pollution while also slightly influencing backpressure and engine performance. Mufflers are critical components for regulatory compliance with noise pollution standards across automotive, industrial, and small engine applications, balancing acoustic performance, exhaust flow efficiency, and durability under high-temperature and corrosive conditions.

The global Engine Exhaust Muffler market size was estimated at USD 11250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
