Report Overview:

Enhanced oil recovery (abbreviated EOR), also called tertiary recovery, is the extraction of crude oil from an oil field that cannot be extracted otherwise.

EOR production is considered as a project in itself and requires a large number of equipment and packages. Studies, pilot projects, engineering design, equipment procurement, feedstock planning, drilling and other materials, play important role in EOR projects. Upfront capital costs in EOR projects are significant. Each link is very complicated, so it is difficult to calculate all the income generated by the EOR project. In addition, because some expenditures come from the oilfield developers themselves, this part of revenue is considered as the operating costs of the oilfield developers themselves. It is therefore necessary to explain the scope of the data reported.

The Global Enhanced Oil Recovery Market Size was estimated at USD 3950.04 million in 2023 and is projected to reach USD 5114.52 million by 2029, exhibiting a CAGR of 4.40% during the forecast period.
