Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Enteric Methane Mitigation Additives competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Enteric methane mitigation additives are substances added to livestock feed to reduce the amount of methane produced during digestion, particularly by ruminants like cows and sheep. Methane is generated as a byproduct of microbial fermentation in the animals' stomachs, especially in the rumen, and is a significant contributor to agricultural greenhouse gas emissions. These additives work by altering the gut microbiota or fermentation processes to reduce methane output without harming the animals' health or productivity. The product's production volume in 2024 was approximately 2,800 tons, with an average price of \$24 per kilogram. The upstream processes of feed additives for methane mitigation mainly involve the research, development, and production of active compounds that reduce enteric methane emissions in livestock, such as nitrates, essential oils, tannins, probiotics, or synthetic compounds like 3-NOP. This stage includes raw material sourcing, formulation, and manufacturing by chemical, biotechnological, or agricultural companies. The downstream processes encompass the distribution, integration, and application of these additives in livestock feed by feed mills, farmers, and dairy or meat producers. It also includes monitoring efficacy, regulatory compliance, and carbon accounting to measure emission reductions for sustainability reporting or participation in carbon credit schemes.

The global Enteric Methane Mitigation Additives market size was estimated at USD 69.14 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.90% during the forecast period.
