Report Overview:

Hand, foot and mouth disease (HFMD) was first reported in New Zealand in 1957 and occurs mostly in young children, with a peak incidence at about 2 years of age. The causative agents of HFMD are picornaviruses, most often of human enterovirus species A, chiefly the Coxsackie A viruses and Enterovirus A71 (EV71). To date three vaccines against EV71 have been licensed in China, all using C4 genogroup strains. The efficacy of these three vaccines after two doses immunization ranges from 90.0% to 97.4% after one year of surveillance to 95.1% after two-year follow-up. Candidate vaccines containing B4 and B5 genogroups are in development elsewhere but have not yet reached the licensing stage. Other vaccines such as recombinant and other forms of subunit vaccines, vectored vaccines, virus-like particle vaccines are in the early stage of development. In addition, the development of vaccines against Coxsackie A16, A6 and A10 is being considered with a view to developing combination/multivalent vaccines

The Global Enterovirus Vaccine Market Size was estimated at USD 344.74 million in 2023 and is projected to reach USD 483.51 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
