Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Environmentally Friendly Coalescing Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Environmentally Friendly Coalescing Agents refer to those that have little impact on the environment and human health during production and use. They usually refer to low-VOC (volatile organic compounds) or non-VOC agents. They mainly promote the rapid and uniform formation of dense paint films in products such as coatings by lowering the minimum film-forming temperature of the emulsion. The upstream supply primarily consists of basic chemical raw materials and green alternative raw materials, including high-boiling-point esters, polyols and their derivatives, and bio-based fatty alcohols. Raw material prices, the stability of green raw material supply, and the purity of intermediates directly determine the cost and final product. With the tightening of global environmental regulations and the adoption of green building standards, traditional high-VOC additives are being phased out due to their strong odor and long release cycle. Environmentally friendly coalescing additives have become a key development direction for the coatings additive industry. Global sales in 2024 are expected to be approximately 390,000 tons, with an average market price of approximately \$1,600 per ton. Single-line production capacity varies depending on the production process and investment in the production facility, typically ranging from 3,000 to 10,000 tons per year, with industry gross profit margins ranging from 20% to 35%.

The global Environmentally Friendly Coalescing Agent market size was estimated at USD 624.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
