Report Overview

Enzymatic plastic degradation refers to the biological process by which certain enzymes break down plastic materials into simpler, less harmful components. Unlike traditional physical or chemical recycling methods, enzymatic degradation leverages specific enzymes produced by microorganisms, such as bacteria and fungi, which can metabolize plastics like polyethylene and PET (polyethylene terephthalate). These enzymes act as catalysts to degrade the plastic polymers, reducing them to smaller molecules that can be further broken down or assimilated by the environment. This process offers a potentially sustainable solution to the growing issue of plastic waste, as it can lead to more efficient and eco-friendly recycling and disposal methods, while mitigating the environmental impact of plastic pollution.

The global Enzymatic Plastic Degradation market size was estimated at USD 45 million in 2023 and is projected to reach USD 183.46 million by 2032, exhibiting a CAGR of 16.90% during the forecast period.
