Abstracts

Enzymatic plastic recycling is an innovative process that uses specialized enzymes to break down plastic materials into their basic building blocks, allowing them to be recycled into new plastic products. Unlike traditional mechanical recycling, which often degrades the quality of the plastic, enzymatic recycling targets specific polymers, such as PET (polyethylene terephthalate), and depolymerizes them into monomers with high efficiency. These monomers can then be repolymerized into high-quality, virgin-like plastic. This method is more environmentally friendly, as it requires less energy, produces fewer emissions, and can potentially handle a wider range of plastic types, including contaminated and colored plastics. It holds great promise for addressing the global plastic waste problem by enabling a more circular approach to plastic production and reuse.

The global Enzymatic Plastic Recycling market size was estimated at USD 53.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.90% during the forecast period.
