Abstracts

Epidural Filter is a key component of epidural anesthesia kits, which are divided into Flat type and Disc type, of which Flat type dominates the current epidural anesthesia kits. Epidural anesthesia is a medical procedure that blocks the sensation of pain in a specific area of the body by injecting drugs in the back. During epidural surgery, anesthetics or painkillers are injected into the epidural space, which can temporarily paralyze spinal nerves and block pain signals from the spine to the brain. Epidural anesthesia surgery is divided into two types: conventional and combined spinal epidural anesthesia (CSE), and the anesthesia kits required for different types of surgery are also different. Epidural anesthesia is widely used in labor, delivery (including cesarean section), and pelvic and lower limb surgery. In addition, it can be used in combination with general anesthesia for chest, abdominal and pelvic surgery, as well as pain management after these surgeries. The main purpose of epidural anesthesia is to reduce or prevent the patient's pain. Epidural anesthesia kit is a medical device package used for epidural anesthesia surgery, which includes a Filter for Regular Epidural Needle, Epidural Catheter, syringe, Epidural Filter and other necessary components. The main function of the Epidural Filter is to filter a small amount of aqueous solution online during the injection process into the epidural space to remove any particles or bacteria that may be present.

The global Epidural Filter market size was estimated at USD 151.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
