Report Overview:

Epitaxial has been a primary application of Chemical Vapor Deposition (CVD). In semiconductor manufacturing, epitaxial processes are used to produce the perfect crystal layers needed to manufacture semiconductor devices, to deposit crystal films with the designed electrical properties or to modify the mechanical properties of the substrate to enhance its electrical conductivity.

The epitaxially grown new single crystal layer can be different from the substrate in terms of conductivity type, resistivity, etc., and can also grow multi-layer single crystals with different thicknesses and different requirements, thereby greatly improving the flexibility of device design and device performance. The epitaxial process is also widely used in PN junction isolation technology in integrated circuits and in improving material quality in large-scale integrated circuits.

The core of an epitaxial (epi) reactor is the reaction chamber, typically made of quartz. Inside the chamber a holder for the silicon substrates, typically made of graphite coated with silicon carbide, is heated up to 900-1250°C while gases flow inside. These gases contain a volatile silicon compound and some dopant compounds carried by a chemical reducing or inert main gas flow.

The Global Epitaxial Reactor Market Size was estimated at USD 1497.85 million in 2023 and is projected to reach USD 2403.44 million by 2029, exhibiting a CAGR of 8.20% during the forecast period.
