Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Epoxy Activated Agarose competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Epoxy Activated Agarose is a chemically modified agarose bead matrix used in affinity chromatography and biomolecule immobilization, produced by attaching reactive epoxy groups to agarose beads. Its supply chain starts with agarose extracted from red algae, refined and formed into beads, then activated with epoxy reagents in specialized facilities. Upstream involves seaweed cultivation and agarose production, midstream covers bead functionalization and quality control, and downstream distribution serves pharmaceutical companies, biotech labs, diagnostics makers, and research institutions for protein purification and enzyme immobilization. The Epoxy Activated Agarose industry sustains an annual output of about 5,200 tons, backed by a global production capacity of roughly 7,000 tons per year, with manufacturers achieving an average gross margin of 44%. The material is priced between USD 12,000-28,000 per ton, depending on bead size, pore size, and activation chemistry.

The global Epoxy Activated Agarose market size was estimated at USD 145.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
